PRODUCT VISION CARD

FOR collegiate athletes, teams, and fans

WHO want to know the estimated NIL value of players

NowIL is a college sports stats web app

THAT lists NIL valuation estimations of collegiate athletes

UNLIKE On3 Sports

OUR PRODUCT provides real-time NIL projection updates based on live player metrics and performances

MARKET ANALYSIS

1. Target Audience

The target audience for our application includes college athletes to track their own market growth, coaches to assess player potential, athletic departments to track the maximization of their spending, sports analysts, and fans who want to dive into the fundamentals of projected player Name, Image, and Likeness (NIL) values. With the vast audience that the application reaches, the platform serves users who simply care about the measurable impact of the evolving world of NIL deals, allowing for comparisons of players across conferences, evaluations of performance relative to their compensation, and simply monitoring a player's NIL value throughout a season. By having the realtime statistical output of a player's NIL metric, the application appeals to both decision makers in the world of collegiate sports along with sports enthusiasts.

2. Existing Apps

The current market of Name, Image, and Likeness values lacks a platform that can provide real-time NIL projections directly to any user based on live player metrics. While companies such as On3 Sports, ESPN, and a site called EvanMiya publish overall NIL evaluations and player data, no one site dynamically combines the two metrics and adjusts projections based on in-game performance, making this a largely untapped market. Other sites such as Compass NIL or Opendorse, focus on either connecting athletes with those looking to branch into the NIL market or player resources for earning NIL deals, both of which are still not relating to the market the application is trying to fill. This disparity in the market creates a strong opportunity in positioning ourselves to be on the forefront of curating live sports data with the intent of creating a compensation benchmark system.

3. Go-To-Market Strategy

Our go-to-market strategy would begin with a controlled launch feature, specifically testing our product with one sport with only a few teams ranging in conferences to demonstrate core functionality and showcase user demand for the application. With the application relying on reliable sports APIs, such as SuredBits and CollegeFootballData.com for frequent data updates, this will ensure it maintains the NIL metric for consistent and credible projections as the project can be scaled.

USER STORIES

Search/Finding Players:

1. As a sports fan, I would like to see currently trending players from the home page, so I can see who has the biggest changes in NIL value this week.
2. As a sports fan, I want to select a specific sport or league and see a list of all of the players with their NIL values displayed, so that I can build the best fantasy team.
3. As a team manager, I want to be able to search for and view specific players or teams by name, so I can evaluate players I'm interested in.
4. As a team manager I want to be able to sort by and order lists of players in a league by NIL value, NIL change, performance, social media following, and position so that I can scout to recruit players for professional teams.

View Player:

5. As a player, I want to see my player profile with current projected and base NIL valuation, so that I can understand how much my brand value really is.
6. As a sports fan, I want to select a player's profile and see all of their stats and information like average points per game, position, team, age, and social media following so I can see what factors influence their NIL evaluation.
7. As a player, I would like to see a list of all my performances and see how my NIL value changed for each one, along with the stats for that

game, so I can better understand how my recent performances affect my NIL evaluation.

8. As a team manager, I would like to see a chart in a player's profile showing how their NIL changes after each performance, so I visually see trends in my player's values across multiple weeks.
9. As a player, I would like to directly compare two or more players at once, so I can see how my NIL and stats compare to similar performing players in my position.

Favorite Players:

10. As a sports fan, I want to be able to 'follow' certain players' NIL when viewing them so I can receive updates (notifs) when that player's score rises or drops.
11. As a sports fan, I want a "Players you follow" page so I do not have to search for players I frequently check.
12. As a sports fan, I want to see recent sports news related to NIL on the app, so that I can keep up with any big deals.

NON-FUNCTIONAL REQUIREMENTS

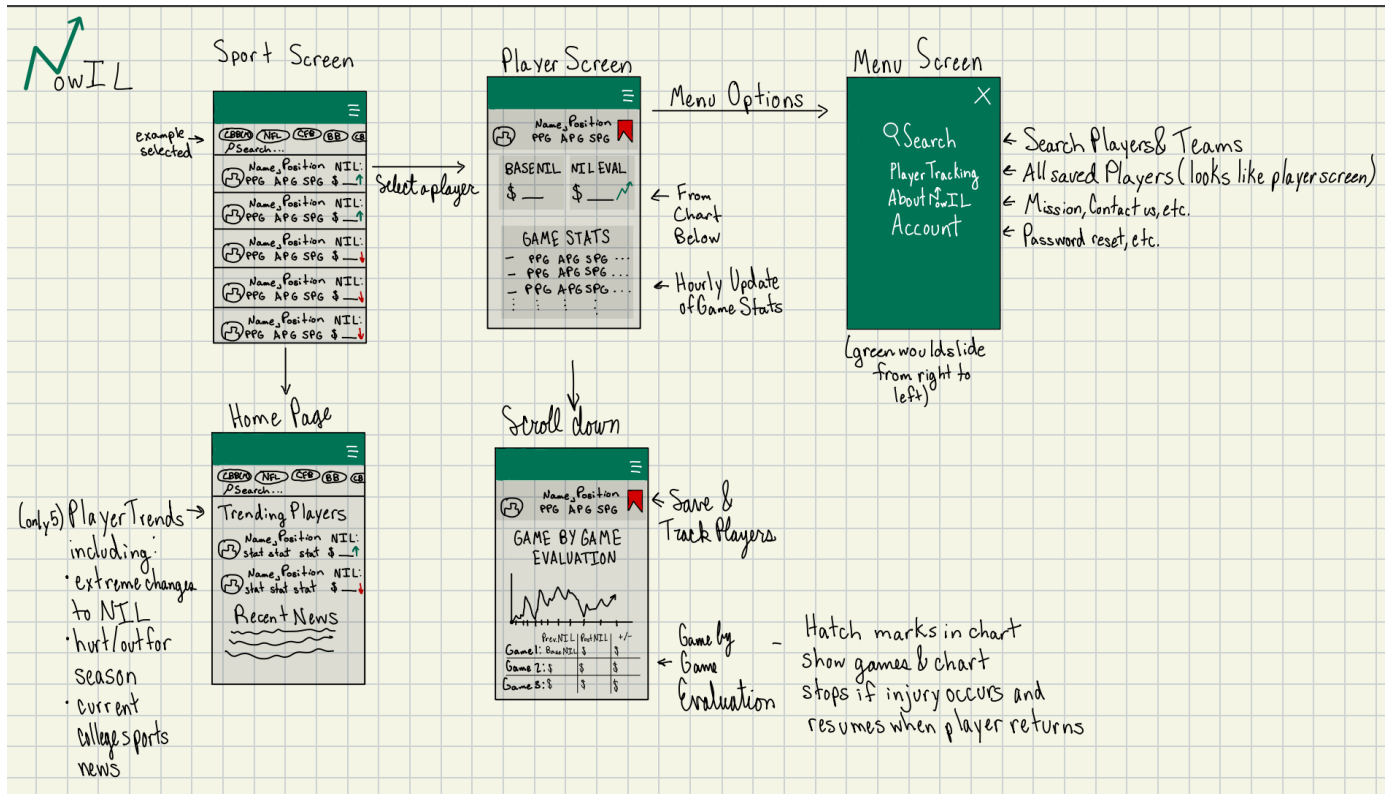

Write in table format from class, in slides

Recency - NIL scores must reflect recent performance, engagement, and valuation factors. The application should minimize delays between data changes and score updates so users can rely on the app for hourly updates that are accurate to the most recent games.

Scalability - The application should be designed to handle growth in the number of athletes, sports, and institutions. As usage and the amount of data increases, the system must continue to function efficiently without requiring major architectural changes.

Accuracy - Users must be able to trust that NIL scores are calculated correctly and that the application performs reliably. The system should minimize errors, and maintain consistent behavior across updates and sessions. Data collected for our model must be accurate and abundant to create accurate evaluations.

Initial Concept Sketch

SELF EVALUATIONS

Kaden: Wrote 2 of the user stories, wrote out the non-functional requirements, and started the product vision card.

Melanie: Wrote 6 of the user stories, Digitized the Logo, completed the product vision card

Vanik: Wrote 5 of the user stories, added 3 target audiences, searched for 5 already existing apps

Joshua: Rewrote and created additional user stories to more clear and consistent

Alexis: Wrote out the Market Analysis, searched for reliable APIs, found 2 existing programs, pitched idea and drew out initial design concept
